Hypothetical protein OSJNBb0011E04.106.

Name-CSJNBb0011E04.106.

Norac Sativa (japonica cultivar-group).

Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; C Spermatophyta; Magnoliophyta; Liliopsida; Poales; Poaceae;

Enrhartoidaea; Oryzae; Oryza.

NCBI TaxID-39947;

NGI TaxID-39947;

Sasaki T., Matsumoto T., Katayose Y.;

Sasaki T., Matsumoto T., Katayose Y.;

Submitted (JUN-2002) to the EMBL/GenBank/DDBJ databases.

EMBL; AP005443; BAD05624.1; -.

Hypothetical protein.

Novel isolated Apo-2DcR polypeptide useful for modulating apoptosis in

The present invention relates to the isolation of novel human polypeptides, designated Apo-2DCR, and the polynucleotide sequences encoding them. Apo-2DCR is capable of binding Apo-2 ligand and is useful for modulating programmed cell death or apoptosis in mammalian cells. Apo-2DCR can be used to produce apo-2DCR antibodies which are useful therapeutically, and can cross-react with other receptors for Apo-2 ligand to block excessive apoptosis in neurodegenerative diseases, or to block potentially autoimmune or inflammatory effects. Apo-2DCR antibodies are also useful in immunchistochemistry staining assays or diagnostic assays for Apo-2DCR, e.g. detecting it's expression in specific cells, tissues or serum, and for the affinity purification of Apo-2DCR from recombinant cell culture or natural sources. The present sequence

The invention is useful in inducing apoptosis in mammalian cancer cells. The invention is also useful in diagnostic procedures for tissue-specific typing and in generating transgenic animals that are useful in development and screening of reagents. The invention is also useful in development the present sequence is Apo3/DR3 death domain protein.

The invention is useful in diagnosing, treating and preventing cancer, tissue typing, in generating antibodies and transgenic animals. The invention is also useful in gene therapy. The present sequence is human Apo-3/DR3 protein. This sequence is used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel human adriamycin-inducible killer protein located on chromosome 8p21, which also has p53-inducible, apoptosis-mediating activity and comprises an amino-terminal extracellular receptor, transmembrane and death domains. The nucleic acid molecule which encodes the protein, it's encoded signal transduction protein and antibodies of the invention are useful in the diagnosis and treatment of neoplastic diseases. The invention is also useful for the
                                                                                                                                                                                                                                                                                                                            A new nucleic acid encodes a p53-induced protein (Killer) - which induces apoptosis and is useful in the diagnosis and treatment of neoplastic

The present sequence is the death domain of DR3. It was used for comparison to a domain of a novel human tumour necrosis factor receptor, designated TR9. The TR9 receptor is also known as Death Domain Containing Receptor 6. TR9 polypeptides, polymuclectides or agonists are useful for treating, preventing or diagnosing common variable immunodeficiency, X-linked agammaglobulinaemia, severe combined immunodeficiency and Wiskott-Aldrich syndrome, autoimmune diseases (such as rheumatoid arthritis, allergic encephalomyelitis, multiple sclerosis, diabetes mellitus and asthma), HIV infection, epilepsy, cancer, cardiovascular diseases and other neurological diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid molecule encoding a human tumor necrosis factor receptor, known as TR9, useful for treating, preventing and diagnosing severe combined immunodeficiency, autoimmune diseases, HIV infection, epilepsy

                                                                                                                                                                                                                                           polypeptides, designated Apo-20ck, and the polymucleotide sequences encoding them. Apo-20ck is capable of binding Apo-2 ligand and is useful for modulating programmed cell death or apoptosis in mammalian cells. Apo-20ck can be used to produce apo-20ck antibodies which are useful the rapeutically, and can cross-react with other receptors for Apo-2 ligand to block excessive apoptosis in neurodegenerative diseases, or to block potentially autoimmune or inflammatory effects. Apo-20ck antibodies are also useful in immunohistochemistry staining assays or diagnostic assays for Apo-20ck, e.g. detecting it's expression in specific cells, tissues or serum, and for the affinity purification of Apo-20ck from recombinant cell culture or natural sources. The present sequence is given in the Seq listing but is invention. Note: The present sequence is given in the Seq listing but is

The present invention relates to the isolation of a biologically active Apo-2 ligand inhibitor (Apo-211) or Apo-3, and the polymucleotide sequences encoding them. Apo-211 and Apo-3 are involved in apoptosis. The Apo-211 and Apo-211 and Apo-211 in affainty purification techniques, and in competitive-type receptor binding assays when labelled with radioiodine, enzymes or fluorophores. Agonistic Apo-3 antibodies are useful for stimulating or inducing apoptosis in cancer calls, and thus have therapeutic utility. The present sequence represents the death domain of a human TNF receptor family protein. This sequence is compared with the death domain of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

                                                                                                                                                                                                                                                                          5
                                                                                                                                                                                                                                                                                    1 VMDAVPARRWKEFVRTLGLREAEIEAVEVEIGR-FRDQQYEMLKRWRQQQP---AGLGAV 56
                                                                                                                                                                                                                                                                                                The present invention provides novel Apo-2 protein and the nucleic acid encoding the protein. The invention is useful in inducing apoptosis in mammalian cancer cells. The invention is also useful in diagnostic procedures for tissue-specific typing and in generating transgenic animals that are useful in development and screening of reagents. The invention is also useful in gene therapy. The present sequence is TNPR1 (tumour necrosis factor receptor 1) death domain protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides novel Apo-2 polypeptide and the encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for
                                                                                                                                                                                                                                                              Gaps
                                            New Apo-2 polypeptide or its extracellular or death domain sequence, useful for modulating apoptosis in mammalian cancer cells or for generating transgenic or knockout animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Apo-2 protein; apoptosis; cancer; tissue typing; transgenic animal; gene therapy; human; TNFR1; receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New Apo-2 polypeptides and encoding nucleic acid molecules, useful diagnosing, preventing or treating cancer, and in tissue typing or

The nucleic acid molecule which encodes the protein, it's encoded signal transduction apprecial and antibodies of the invention are useful in the diagnosis and treatment of neoplastic diseases. The invention is also useful for the production of animal model systems
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A new nucleic acid encodes a p53-induced protein (Killer) - which induces apoptosis and is useful in the diagnosis and treatment of neoplastic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        production of other cyckines in other cell populations. The population of other cyckines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cyckkinelike activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, individual activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; archititis; inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is the death domain of TNFR 1. It was used for comparison to a domain of a novel human tumour necrosis factor receptor, designated TR9. The TR9 receptor is also known as Death Domain Containing Receptor 6. TR9 polypeptides, polynucleotides or agonists are useful for treating, preventing or diagnosing common variable immunodeficiency, X-linked agammaglobulinaemia, severe combined immunodeficiency and Wiskot-Aldrich syndrome, autoimmune diseases (such as rheumatoid arthritis, allergic encephalomyelitis, multiple sclerosis, diabetes mellitus and asthmal, HIV infection, epilepsy, cancer, cardiovascular diseases and other neurological diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                65
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid molecule encoding a human tumor necrosis factor receptor, known as TR9, useful for treating, preventing and diagnosing severe combined immunodeficiency, autoimmune diseases, HIV infection, epilepsy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               receptor (p55 TNF-R). The death domain of the p55 tumour necrosis factor receptor (p55 TNF-R). The death domain (DD) of human Fas-ligand receptor (FAS-R), ankyrin 1, nerve growth factor receptor (NGF-R) and MORT-I.

(which binds to the intracellular portion of (FAS-R)) are also given (see AAW00206-07 and AAW00209-W00210). These DDs are used to identify compounds capable of modulating activity of the regulatory proteins (p55, NGF, TNF and FAS-R ligand, WORT-I) via interaction with the DDs. Such modulators which may be antibodies, antiense sequences or ribozymes (which can affect the cellular mRNA sequences encoding the proteins) and are useful for modulation of effects of the regulatory proteins within the cell. Tumour cells, HIV-infected cells or other diseased cells can be treated by targeting the cells with animal viral vectors encoding the modulators and a viral surface antigen capable of binding to a specific receptor. The DDs are characterised by having groups of common amino acid residues Trp, Ala, Asp, Glu, Thr, Arg and Tyr within locations that can be aligned to show homology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Modulator of regulatory cellular events mediated by "death domain" contg. regulatory proteins - useful for modulating functions mediated in cells by proteins contg the death domain.

The invention describes a new isolated polypeptide comprising: a polypeptide or its mature form comprising a sequence not given in the specification; or a variant of (A), where one or more amino acid residues in the variant differs in no more than 15% from the amino acid sequence of the mature form. The pharmaceutical composition may be administered via oral, transdermal, rectal or parenteral route. The polypeptide, nucleic acid or antibody is useful for preparing a composition for treating or preventing a NOVX-associated disorder, e.g., cancer. This is the amino acid sequence of a protein associated with analysis of domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  6 LLDDPLGRDWRRLARKLGLSEEEDQIEHENPRLASPTYQLLDIWEQRGGKNATVGTLLE 65
